NOTES FROM LENNY'S PODCAST

Most automations skip one part.

It's the part that matters most. Here's what a podcast episode taught me about building loops for my vacation rental.

THE IDEA

Recurring work is turning into loops.

Anish Acharya (a16z) described AI agents taking a bug report through reproduction, a fix, review, deployment, and a customer email in about five minutes.

Humans still own sales, strategy, exceptions, and deciding what's worth building.

> From my Snipd notes · Lenny's Podcast, "Why companies are becoming a series of loops" (paraphrased)

THE DETAIL I KEEP THINKING ABOUT

Kavak's AI agents call a human when they get stuck.

The human's coaching resolves the case and leaves a trace, so the agent is less likely to repeat the mistake.

Getting stuck is part of the design.

> Anecdote from the same episode (paraphrased from my Snipd notes)

THE LOOP AUDIT

A loop has five parts.

1 Trigger
The event that starts it, not someone remembering

2 Steps
What happens, in order, every time

3 Decision
The one fork: one question, two answers

4 Output
What exists when it finishes

5 Escape hatch
What happens when it gets stuck, and who it tells

The one most people skip

MY TEST CASE

The daily staff text at La Maison

Trigger	A day someone is on the schedule
Steps	Gather assigned staff, contractor work, arrivals
Decision	Guest arriving? Name them, or "No guest checking in"
Output	One text, up to once a day
Escape hatch	Still designing it. That's the honest answer.

Running the audit showed me where this loop is most likely to break first.

THE CHECK

Will a human find out when it fails?

If not, that's likely where the loop breaks first.

Pick one recurring job in your business this week and map it.

Trigger → Steps → Decision → Output → Escape hatch
